Casi siempre cuando pensamos en una lámpara pensamos en materiales como el plástico, la tela y el metal que son los que se han utilizado tradicionalmente. Las fibras naturales y la madera laminada permiten efectos cálidos y con tramas ricas en textura pero tienen formas limitadas. Es por esta razón que luciole lamps busca rescatar la riqueza de los colores y transparencias que tiene la madera, combinando estas cualidades con la tecnología que permite imprimir formas complejas e improbables que generen efectos lumínicos nuevos controlados a distancia para finalmente no solamente proponer formas diferentes pero también nuevas interacciones con estos objetos luminosos inteligentes de madera impresos en 3d.

eng

Almost always when we think of a lamp we think of materials such as plastic, fabric and metal, which are those that have been used traditionally. Natural fibers and laminated wood allow for warm, woven effects rich in texture but have limited shapes. It is for this reason that luciole lamps seeks to rescue the richness of colors and transparencies that wood has, combining these qualities with the technology that allows printing complex and improbable shapes that generate new remote controlled lighting effects to finally not only propose different shapes but also new interactions with these 3d printed wooden smart light objects.

Presque toujours, lorsque nous pensons à une lampe, nous pensons à des matériaux tels que le plastique, le tissu et le métal, qui sont ceux qui ont été utilisés traditionnellement. Les fibres naturelles et le bois lamellé permettent des effets tissés chauds et riches en texture, mais ont des formes limitées. C'est pour cette raison que les lampes luciole cherchent à sauver la richesse des couleurs et des transparencies du bois, combinant ces qualités avec la technologie qui permet d'imprimer des formes complexes et improbables qui génèrent de nouveaux effets d'éclairage télécommandés pour enfin proposer non seulement différentes formes mais également de nouvelles interactions avec ces objets lumineux intelligents en bois imprimés en 3D.
